

Module: R4: Computer Architecture
Section: Caches Task: Memory Accesses

Task 2

Memory Accesses

Scenario 2

1. Program Parameters:

```

3 # You MAY change the code below this section
4 main:  li a0, 256      # array size in BYTES (power of 2 < array size)
5        li a1, 2        # step size (power of 2 > 0)
6        li a2, 1        # rep count (int > 0)
7        li a3, 1        # 0 - option 0, 1 - option 1
8 # You MAY change the code above this section

```

2. Cache Parameters:

	Registers	Memory	Cache	VDB
Cache Levels	<input type="text" value="1"/>			
Block Size (Bytes)	<input type="text" value="16"/>			
Number of Blocks	<input type="text" value="16"/>			
Associativity	<input type="text" value="4"/>			
Cache Size (Bytes)	<input type="text" value="256"/>			
<input type="button" value="Enable?"/>	Enables current selected level of the cache.			
<input type="button" value="N-Way Set Associative"/> ▼				
<input type="button" value="LRU"/> ▼ <input type="button" value="L1"/> ▼				

➤ Questions:

1. **How many memory accesses are there per iteration of the inner loop (not the one involving Rep Count)?**

Hit Count: 48

Accesses: 64

Since each iteration of the inner loop involves two memory accesses (read and write), we can calculate the number of memory accesses per iteration:

$$\text{Memory accesses per iteration} = \frac{\text{Total Accesses}}{2 * \text{rep}}$$

$$\text{Memory accesses per iteration} = \frac{64}{2 * 1} = 32$$

2. What is the repeating hit/miss pattern?

The repeating hit/miss pattern can be determined from the visualization. We observe from the accesses and the hit count which demonstrates that every 4 accesses result in 3 hits and 1 miss. Henceforth, the hit rate of 0.75.

The repeating pattern is *mhhh*.

3. Keeping everything else the same, what does our hit rate approach as Rep Count goes to infinity?

As we increase our rep-count, our Hit Rate approaches to 1 which can be calculated from the following formula:

Assuming: Rep-Count = 88

$$\text{Hit Rate} = \frac{\text{Hit Count}}{\text{Total Accesses}} = \frac{5612}{64 * 88} = 0.99644 \approx 1.0$$

4. Fill in the BLANKS

We should try to access one [**segment**] of the array at a time and apply all of the [**functions**] to that [**segment**] so we can be completely done with it before moving on, thereby keeping that [**segment**] hot in the cache and not having to circle back to it later on.
